Executive Summary

Computer Science undergraduate with hands-on experience in full-stack development, cloud-hosted backend systems, and applied machine learning. Have built and shipped software spanning REST APIs, cloud infrastructure on AWS, and AI-assisted platforms, through internships and team-based hackathons, and I'm comfortable working within larger distributed system setups.

Education

B.Tech in Computer Science and Engineering **CGPA: 8.17**
Amrita School of Computing, Amrita Vishwa Vidyapeetham, Coimbatore *2023 – 2027*

Experience

Hivetz Nutri Private Limited **Sri Lanka (Remote)**
Full-Stack Developer Intern *Jul 2025 – Jan 2026*

- Built an inventory management system with RESTful APIs and optimized database schemas to track stock across locations.
- Added role-based access control and real-time low-stock alerts for different user roles.

Latlon Technologies **Coimbatore, India (On-site)**
AI Intern *May 2026 – Jun 2026*

- Built an agentic workflow where AI agents understand the full codebase through a GitHub-linked knowledge graph, and could implement features, write tests, schedule cron jobs, and do research on their own, matching the output of about 4 engineers working in parallel.
- Provisioned the underlying AWS infrastructure (EC2, ECS Fargate, S3, DynamoDB, Cognito) using AWS CDK in TypeScript to keep the agent platform running reliably.

Projects

Rezo – Civic Issue Reporting & Management Platform **Aug – Nov 2025**
Roboflow, FastAPI, React Native, Google Maps API, Supabase

- Built a mobile app for reporting and tracking local civic issues, with location-based tracking and support for multiple languages.
- Fine-tuned an object detection model (RF-DETR) and hosted it on Roboflow to classify issue photos submitted through the app.
- Combined issue confidence and location proximity into a priority score, shown on a live Google Maps dashboard.

Lazarus – AI-Assisted Codebase Migration Tool **Jan – Mar 2026**
AWS Bedrock, FastAPI, Docker, Next.js, AWS Lambda, DynamoDB, S3

- Built a tool that uses AWS Bedrock (Claude LLM) to analyze a legacy GitHub repo, plan changes, and deploy a working version, running on containerized, serverless AWS infrastructure.
- Split the process into stages (analyze, plan, build, deploy, validate).
- Implemented a self-healing AI engine that reads runtime error logs, patches failing code, and re-deploys automatically.

Joulet – Solar Energy Data Verification System **Feb – Mar 2026**
Python, Flask, React, Solidity

- Worked with a team to build a system that checks solar power output data against basic rules (capacity limits, daylight hours, sudden spikes) before recording it.
- Helped build the Flask backend and connect it to a smart contract that records verified data and mints tokens on-chain.

Technical Skills

Languages: Python, JavaScript, Java
Cloud & Distributed Systems: AWS (EC2, ECS Fargate, Lambda, S3, DynamoDB, Cognito), AWS CDK, Docker, Linux
Backend & Databases: Node.js, Express.js, FastAPI, Flask, MongoDB, MySQL, Supabase
Frontend & Mobile: React.js, React Native, Next.js, HTML, CSS
AI/ML Tools: TensorFlow, Roboflow, Scikit-learn

Achievements

- Finalist, **Civic Stack Hackathon** – IIT Delhi Finalist, **AWS AI for Bharat Hackathon** Finalist, **Technova Hackathon** – CIT

Certifications

Foundations of Blockchain – Cyfrin Updraft

Languages Known

English (Professional) **Tamil** (Native) **German** (Intermediate)
